Dear Renata, and other DOJ participants in the MS antitrust suit.

I'm a Swede that induced by problems with the W98 "OS" during the shift between 98 / 99 went ravingly mad over a crashing computer while heavily dependent on the same while promoting finance of some mines and Oilfield in the Republic of Kasachstan.

So if that were not difficult enough, when having an obstructive computer loaded with expensive analysis software, that constantly gave up on me.

Well,, everything ended up in a judicial assault by corrupted structures in the Republic of Latvia

Clearly another story, but inevitably linking me in to the Microsoft issue again.

Forced to give up all financing work remigrating to Sweden completely out of cash after six months in closed arrest, it came on me again.

Tried to find a job in computing, as in ground being an Electronic Engineer with some 25 years of experience in microelectronics and software, really from scratch.

The Swedish authorities had introduced a "Drivers License" for computers based on MS windows, Hi Dee Hoo.

Almost all educational material were based on the highly manipulative MS Visual Studio, as I regard to be in violation of a principal human right, The freedom to Assemble.

Was essentially subjected to a boycott as being able to define MS structured program generating Creativity Suites, tying up program creation to API's while it exist compilers f.o.x. Inprise Borland Bcc32 generating close to OS independent byte code, as well as Assembler and of course Java that Microsoft tried to obstruct by introducing their own API's in the MS version. The Java maneuvering actually flashed back a bit as MS Java don't perform as well as the original SUN product, even on Windows.

Though not a US citizen, I've lobbied hard against MS initially through a member of the US congress Judiciary Committee between the end of Mars 99 to November 99.

I regard Microsoft a a world wide plague, and could participate the ability to produce software enslaving the users. The issue "To use Software, or to be used by it" turned obvious, as MS already was on their way to implement it in full scale.

Take their "Product range" Windows 95 / 98 / ME / XP / NT 3 / 4 / 5 "2000"
I can and I've installed all API's of those "products" on my close to four years old machine everything works extremely well after some stripping down of highly experimental automation code (mostly producing system crashes), that in every way has to be done

in order to have a non kamikaze computer.

Talk about "The Emperors New Clothes"

So be it.

Must congratulate you to you conclusions and the remedy proposed.
The "Violating Structure" must either comply or face self erosion.

Well done.

O.K. Microsoft have created jobs, but based in poor software, generating problems, generating maintenance, and so forth.

What will happen if that grows, and finally collapses, as most Windows OS's do, but in full scale ?

Would not personally object if Gates serves life long prison,
remembered for to introduce "the human factor" into a machine
that properly loaded never fails.

With My Best !!!!

Peter Johansson.
